Synthetic Clinical Note

Abstract

Background: This synthetic clinical note is generated for testing the Weslr document ingestion pipeline. Methods: We applied automated NLP extraction to structured clinical text. Results: The pipeline correctly identified 4 facts across 2 pages with an average trust score of 0.76. Conclusion: Document ingestion for Phase 4.1 is functioning within expected parameters.

Methods

Patient cohort consisted of 50 simulated cases. Text was processed using PDF extraction with page-level segmentation. Facts were extracted using 10 deterministic pattern rules.

Results

Extraction yield: 4 subject-predicate-object triples identified. Precision: 0.94 on synthetic test data. Recall: 0.81 relative to manual annotation.

Conclusion

The document ingestion layer meets Phase 4.1 requirements for deterministic fact extraction from clinical notes.
